

I analyzed five repositories:

- aio-lib/s/aio-kafka
- airbytehq/airbyte
- artefactual/archivematica
- beetbox/beets
- FoundationAgents/MetaGPT

Out of these, aiokafka, archivematica, beets and MetaGPT are Python based repositories. Airbyte is not fully Python because a large part of it is written in Kotlin and Java.

Repository Overview

aiokafka

It IS used for working with Apache Kafka using Python asyncio. It follows an async producer consumer architecture and is mainly used in real time data streaming systems.

archivematica

A digital preservation system used by libraries and archives for storing digital files for long term access. It uses a service oriented and workflow based architecture.

beets

A command-line music library manager that automatically organizes and updates music metadata using MusicBrainz. It mainly uses a plugin-based architecture.

MetaGPT

A multi agent AI framework where different AI agents act like members of a software company such as manager, engineer, and tester. It uses role-based agent communication and async workflows.

Summary Table

Repository	Python %	Purpose	Key Pattern	Domain
aiokafka	93.1%	Async Kafka client	Event-loop I/O, producer-consumer	Real-time streaming
archivematica	83.0%	Digital preservation	Pipeline workflow, service-oriented	Libraries/Archives
beets	96.2%	Music library manager	Plugin/hook system, CLI dispatch	Media management

MetaGPT	97.5%	Multi-agent LLM framework	Role-based agents, message-passing	AI / Software automation
---------	-------	---------------------------	------------------------------------	--------------------------
